

Different wage comparisons. Persons whose income comes from wage only.

For the upper left chart, we could conclude there is a wage gap. However it could be the case that men have a longer work-day. Unfortunately when calculating the wage/hr mean per position (upper right chart), we found that we do not have enough data to work with. This is because the most of the entries has no value for the number of working hours and we need to use positions with both, men and women. We are really restricted. Even more unfortunate is that the error bars in the lower left chart do not allow us to decide whether men's wages are higher than women's ones in those specific positions. Finally, if we use INEGI's estimations (lower right chart) we found that they only estimate wage/hr for job sectors. Inasmuch as there are many positions from the same job sector, we cannot conclude there is a wage gap. Does this mean that there is no such a gap? No, it means that we need to collect more data.
